直联式离心泵 IZ

DIRECT-COUPLED PUMP TYPE

广州市第一水泵厂 广州广一泵业有限公司
GUANGZHOU NO.1 PUMP FACTORY GUANGZHOU GUANGYI PUMP INDUSTRY CO.LTD.

执行标准：Q/GZGY75-2008
APPLICABLE STANDARD: Q/GZGY75-2008

用途

IZ型泵是单级直联式离心泵，广泛用于工业和城市排水、高层建筑增压送水、消防供水、空调系统以及农业排灌等用途。

USE:

Type IZ pumps are the single-stage closed-couple centrifugal pump which draining for plant and city, water supplied for altitude supercharging, firefight system, air-condition and irrigation etc.

输送介质

主要供吸送稀释的、清洁的、不腐蚀的清水及粘度5℃以下，物理化学性质类似水不含固体颗粒或纤维的液体。

TRANSMITTED MEDIUM

Type IZ pumps are used for pumping diluent, clean, un-corrosive water and liquids under 50 conglutination which characteristic of chemical and physical is similar to water in which does not contain solid granule or fibre.

性能范围

转速	2900r/min
流量	7.5-120m ³ /h
扬程	18.5-127m
功率	1.5-37kW

CAPABILITY

Speed	2900r/min
Capacit	7.5-120m ³ /h
Head	18.5-127m
Power	1.5-37kW

工作条件

最高工作温度：80℃。

WORKING CONDITION
Temperature (Max.): 80

配置

电动机配用Y型全封闭风扇冷却的鼠笼式直联卧式电机。

提供两种不同的安装结构模式，结构Ⅰ型泵安置在铸铁底板上。结构Ⅱ型不需要安装底板，可直接将电机安装在水平底座上。用户可根据情况选择。

SCHEME

The electromotor adopts the type Y motor which with all-closed, fan refrigerant, close-couple and horizontal characters.

By provided 2 kinds of different installation structures, for structure I, the pump is put on the cast-iron motherboard. For structure II, the motor may be put directly on the horizontal base. It may be up to client's preference.

泵说明

采用直联式结构，泵由电动机直接驱动，减少了备件的数量。蜗室、进水法兰和出水法兰铸成一个整体。采用水力和动力平衡的叶轮，悬臂式安装，具有较高的吸水性能和较高的效率，抗汽蚀能力强。采用优质机械密封，使该型泵具有结构简单、性能可靠、体积小、重量轻、噪音低、抗汽蚀性能好、电耗低、使用维修方便的特点。

DESCRIPTION

Type IZ pumps use close-couple in structure which are driven by electromotor in case to reduce quantity of accessories. The suction and discharge flange, the casing and pump foot are all cast to a whole. With good function on absorbing water, high efficiency and resist on steam cauterization, the impellers with hydraulic and dynamic balance are adopted and cantilevering installed in the pumps. By used of excellent mechanical seal, the pumps are simple in structure, reliable in performance, small in size, light in weight, low noises, good resist on steam cauterization, low in power consumption and easy in maintenance.

* 未做过

说明：泵的出水口方向可以根据需要作出相应的旋转。

Note: The outlet of this pump may be relevantly circumrotated to meet the needs.

运行 OPERATIONS

起动

- 泵工作旋转方向从驱动端往泵方向应为顺时针方向。
- 应在机泵运行前确定电动机的旋转方向是否正确，泵的转动是否灵活。
- 关闭吐出管路的闸阀。
- 向泵内灌满水，或用真空泵引水。
- 接通电源，当泵达到正常转速后，再逐渐打开吐出管路上的闸阀，并调节到所需要的工况。在吐出管路上的闸阀关闭情况下，泵连续工作的时间不能超过3分钟。

START - UP

- It should be clockwise when the pump goes round from the start side to the pump;
- Make sure the revolving of electromotor is proper and the pump is turned neatly before the pump is start up;
- Turn off the valve controlled for the pipeline;
- Pump is fill in water or lead in water to the vacuum pump;
- Connect the power supply, open the valve once the pump achieves to be turned properly then adjust to the condition you need. The pump could not work continuously over 3mins when the valve is turned off.

停止

- 逐渐关闭吐出管路上的的闸阀，切断电源。
- 如环境温度低于0℃，应将泵内的水放出，以免冻裂泵体。
- 如长期停止使用，应将泵拆卸上油，包装保管。

PAUSE

- Turn off the valve gradually and cut off the power supply;
- When the environment temperature is lower than 0℃, the water should be put out from the pump in order the pump casing will not be frozen to be cracked;
- If not in use for a long time, the pump should be disassembled, oiled and packed carefully.

运转

- 在开车及动转过程中，必须注意观察仪表读数，轴承发热，轴封漏水及发热及振动和杂音等是否正常，如果发现异常情况，应即时处理。
- 轴承温度最高不高于80℃，轴承温度不得超过周围温度40℃。
- 如密封环与叶轮配合部位磨损过大应更换新的密封环。

WORK

- When driving and operating, should pay attention to the reading of meters, to check if the bearing fever heated, shaft seal leaked & heated and the normal of vibration and cacophony. Anything abnormal, it should take action at once.
- The maximum temperature of bearing can not high then 80℃, the surrounding temperature is not allowed to be over 40℃.
- The new cashing ring should be changed if there is damaged and worn part with the cashing ring and impeller.

注意事项

- 严禁机器干转，以免损坏轴封。
- 应定期检查轴承。
- 泵的管路应有自己的支架，不允许管路的重量加在水泵上，避免把泵压坏。
- 吸水管要每台泵单独安装，而且尽可能短，弯部少。
- 泵用不同的材质制造，承压也不同，工作压力必须与泵的承压相适应。
- 输送非清水类介质时，请提供介质的物理、化学性质与供方协商以确定所选择的泵是否适用，包括泵体和轴封的材质。
- 水泵机组与电源之间的配线及线路维护必须由专业资格的人员进行作业。

WARNING

- Do not let the pump run dry, this could cause damages to the appliance;
- Check the bearing regularly;
- The pump should have its bracket. In order not to press the pump out, it's not allow the weight of pipeline add to it;
- The absorbing pipe should be installed to each pump, and require as short as possible, few crooks;
- The bearing of weight is different as the pump is made by different materials. The working pressure should be accommodated with the bearing of the pump;
- When transition of the medium, please provide its characteristic of chemical and physical and verify with the supplier if the pump you chose is applicable in which including the pump casing and the material of shaft;
- The wiring and the circuit which between the pump unit and power supply should be maintained by the qualified professional.

可能出现的故障及解决办法

故障	原因	排除方法
泵不出水，压力表及真空表指针剧烈跳动。	注入泵的水不够，进水管漏气。	再往泵内注水，堵塞漏气处。
泵不吸水，但真空表显示高度真空。	底阀没打开或堵塞，吸水管阻力太大，吸水高度太高。	校平或更换底阀，清洗或更换吸水管，降低吸水高度。
泵不出水，压力表显示有压力。	泵轴旋转方向不对，出水管阻力太大，叶轮淤塞，转数不够。	改正转向，检查水管长度，清洗叶轮，增加转数。
泵流量减少或扬程下降。	叶轮或管路阻塞，密封环或叶轮磨损严重，转数低于规定值。	清洗叶轮或管路，更换损坏的零件，调整到规定的转数。
泵消耗的功率过大。	叶轮与密封环磨损，流量过大。	消除机械摩擦，关小出水闸阀。
泵内声音反常，吸不上水。	吸水高度过高，吸水管漏气，流量过大，发生汽蚀。	减少吸水高度，堵塞漏水处，调节出水闸阀在规定工况使用。
泵振动厉害	泵发生汽蚀，叶轮不平衡地脚螺栓松动。	消除汽蚀，叶轮校平衡，拧紧地脚螺栓。
轴承过热。	润滑油不足或过多或变质。	检查电机轴承，清洗轴承并换油。

EXCEPTION HANDLES

Malfunction	Reason	Solution
Water could not come out from the pump, pressure meter and vacuum meter are vibrating acutely.	Water is the pump is not enough, the suction leaks.	Fill in the water to the pump and plug up leak.
The pump can not absorb the water, but vacuum meter shows high vacuum	The bottom valve is not opened or plugged, absorbing, resistance are too large, absorbing too high	Checkout or change the bottom valve, clean or change the absorbing, lower the height of absorbing.
Water could not come out from the pump, it shows the pressure at the pressure meter.	The turn direction of shaft is incorrect, too large of the resistance of the discharging pipe, leak from the impeller, speed not enough.	Correct the direction, check the length of pipe, clean the impeller and increase the speed.
Reduce from the Capacity or head of the pump.	The impeller or Piping is blocked, casing ring or impeller is damaged terribly, the speed is lower than normal.	Clean the impeller or piping, change the damaged component and adjust the speed to normal.
The pump is used up which cause the power is too high	The impeller and casing ring are damaged, too large from the capacity	Avoid the mechanical friction, closer valve for the water out
The voice from the pump is abnormal, can not absorb the water	Absorbing is too high, absorbing pipe leak, capacity is too large.	Lower the absorbing, block the leaking place, adjust the valve for water out to be used under stated working condition
The pump is vibrating acutely.	Steam cauterization on the pump, impeller is not balancing and the bolt become flexible	Eliminate the steam cauterization, balance the impeller, fast the bolt.
The shaft is too heat	The lube is less or more or it metamorphoses.	Check the shaft of motor, clean it and change the lube.
